

DAY-3

Date _____
Page _____

- 1 Create a comparison table listing the main difference between DDR3, DDR4, DDR5 RAM, including speed, voltage and typical use cases.

	DDR3	DDR4	DDR5
Voltage	1.5V	1.2V	1.1V
Capacity	Lower	Higher	Much Higher
Speed	Low speed transferring (800 - 2133 MT/s)	Standard data transferring (1600 - 3200 MT/s)	Very fast data transfer (4800 - 8400+ MT/s)
Gaming Performance	Basic games can play like in older PC.	Good games or all games can be played.	Excellent with detailing of every game.

- 2 Open your laptop or desktop, locate the RAM slots and take a clear photo of the installed RAM Module. Reinstall the RAM module and verify that your system boots up successfully.

After shutdowning the laptop and cut off the power supply

Then, opening the 'laptop case',

Seeing where the RAM slots has fixed,
After that, taking the clear pic of
RAM slot which is installed.

Then after, i remove the RAM slot
by opening the both clips off it.

Lastly, now reinstalling the RAM by
taking aligning the notch with slot.

Therefore, i fixed it as usually
as from i have open it.

3 List the three key difference between
SSD, HDD and NVRAM storage types,
and for each, name one app or use
case and that would benefit most
from that storage type.

HDD :- Speed → slowest among all
of device disk.

Technology → using magnetic
spinning disks.

Durability → less durable bcoz of
part are moving, it is
very cheap also.

SSD :- Speed $\rightarrow$ Faster than HDD
to store or to transfer

Technology $\rightarrow$ Uses Flash memory with
SATA interface

Durability $\rightarrow$ More durable and based
use for daily purpose.

NVMe :- Speed $\rightarrow$ Fastest all of the
hard device disk

Technology $\rightarrow$ As, same Flash
memory but PCIe interface

Durability $\rightarrow$ Very high performance
and useful for gaming
purposes.

4 Remove the storage drive from your
system, take a photo of the connector
type and reinstall the drive. Confirm
that your device recognises the storage
after reassembly.

$\rightarrow$ As, usual switch off the computer
Then opening the case

↓
Finding the installed storage drive
and identifying the data connector
of storage disk

↓
Very cheap also

Then, I click the pic of it and taking out the cables and removing storage disk slot

Lastly, reinstalling the storage drive into it slot.

Therefore, Reconnects all the cables and fixed as usual and close the computer case

Hence, After switch on the computer and verifying, wheater device recognizes or not, which completely can be seen working on the screen.
